

Evidence boundary and decision endpoint for static-screen correction

a Independent-product guardrail: sign is supported, materiality is bounded

CSR-material = baseline screen; GSFC diamond = independent check. Tokyo Bay/Yokohama is GSFC-sub-material with local sign support; Mumbai/Bhayandar remains candidate/contradictory; only Delhi is GSFC-material.

b Static-counterfactual payload: most detectable updates remain small

A/B follow-up units: 28 under BH (6 material, 22 targeted)

Direction split: 19 increase-side and 9 depletion-side; 21 metro clusters, 22 GHSL centres, 10 regional groups.

BY sensitivity retains 22 A/B units. Tiers are follow-up flags, not engineering hazard classes.

c Water-management decision endpoint
