

DYNAMIC GROUNDWATER SCREEN FOR LIQUEFACTION REVIEW

3D mechanism candidate: regional storage perturbs only the water-table term; city-level use remains a review cue

Mechanism boundary: regional driver, exposure-unit flag, not an engineering design threshold.

DGLS framework

Dynamic Groundwater-Liquefaction Screening

- 1

Observed storage trajectory

CSR / GSFC / GFZ / JPL-CRI products with local wells where available
- 2

Aquifer-class conversion

$\Delta WTD = \text{storage trend} / S_y$
materiality is aquifer-conditioned
- 3

Published liquefaction screen

Only the water-table term is perturbed; all other predictors remain fixed
- 4

Non-regulatory local review

A/B/C/D classes trigger local wells, CPT/SPT and sediment review

Global null retained; regional bidirectional review cue only
